PRACTICAL 8:

Practical8(1)

Problem Phase:

Implement a binary tree and display its nodes using inorder, preorder, postorder, and level-order traversal.

Solution:

Level-order traversal uses a queue to visit nodes level by level, while inorder, preorder, and postorder use recursion to visit nodes in different orders.

Practical8(2)

Problem Phase:

Insert book codes into a Binary Search Tree (BST) in the correct positions and print the inorder traversal after all insertions.

Solution:

Each book code is inserted to the left if it is smaller than the current node and to the right if it is larger. The inorder traversal prints all codes in ascending order, confirming the BST property.
